

AXON TICKETS

# Event Workspace & Event Readiness Center

Executive brief for a simpler, safer, and more visible way to run events

This version is intentionally written for business readers. It focuses on the customer problem, the product idea, the first release, and why it matters.

## One shared workspace

Instead of scattered files and chat threads.

## Clear ownership

Each important task has a named owner and due date.

## Visible readiness

Leaders can see if the event is on track or blocked.

Updated July 04, 2026

## Why this matters

# The opportunity in plain language

Event organizers often manage one live event across too many places: spreadsheets for planning, chat threads for follow-ups, email for approvals, and a ticketing platform for registrations and payments. That split makes it hard to know what is done, what is late, and who owns the next move.

| Today's pain                                                    | What the new workspace changes                                                    |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Teams juggle spreadsheets, chats, and email.                    | One event workspace becomes the operating home for the whole event.               |
| Leaders do not know what is slipping.                           | Readiness score, blocked items, and milestones make progress visible at a glance. |
| Updates to sponsors and executives are manual and inconsistent. | A clean read-only dashboard shares progress without exposing internal work.       |

## The core idea

Every event gets its own operational workspace inside Axon. The team can track progress, assign owners, monitor blockers, and share a clean status view with sponsors or executives.

## Why Axon can win

# A more useful position than ticketing alone

- Eventbrite is strong in discovery, but this is about execution after the event is already planned.
- Ticket Fairy is strong in sales and marketing, but this focuses on getting the event operationally ready.
- HelixPay is strong in commerce, but this adds day-to-day execution visibility that buyers can feel.
- Axon already handles events, registrations, payments, QR validation, attendance, and reporting, so readiness is a natural next layer.

## What the product is

# A practical operating home for each event

The product is not a generic project management tool. It is a focused event workspace built around the questions organizers ask every week before event day.

## What success looks like

# Signs that the first release is working

- Organizers create an event workspace without extra setup.
- Teams use a checklist template instead of starting in a spreadsheet.
- Important work gets assigned to real owners with due dates.
- Blocked items become visible early rather than appearing at the last minute.
- Leaders can open one dashboard and understand overall readiness in seconds.
- Pilot customers say they depend less on spreadsheets and chat-based follow-up.

## First release

# What fits in the 8-week MVP

The first release should stay intentionally small. Its job is to prove real customer value, not to become a full event operations suite on day one.

### Included now

Organizer onboarding, organization profile, event workspace, checklist templates, status updates, blocked items, owners, due dates, readiness score, and a read-only stakeholder dashboard.

### Saved for later

Volunteer tools, advanced risk tracking, full dependency mapping, automation, AI recommendations, benchmarking, and financial planning.

### Why this is the right size

It tackles the biggest pain first: scattered execution tracking. That gives the team a clean test of product-market value.

### What not to do

Do not broaden the MVP into a generic team workspace. The focus must stay on running events well.

### Recommended success gate

Move into the next phase only if pilot organizers actively use readiness tracking and report that it meaningfully reduces spreadsheet dependency.

## July delivery update

# Four adjacent product packages are ready for UAT

### Referral campaigns

Event-scoped codes support controlled discounts, usage limits, tier rules, attribution, and reporting without trusting browser pricing.

### Better attendee insight

Birthday, gender, and city are collected consistently, creating a foundation for privacy-safe aggregate demographic reporting.

### **Stronger sponsor visibility**

Public sponsor cards now support tiers, descriptions, websites, visibility controls, and safe raster logos - without becoming sponsor CRM.

### **Flexible event storytelling**

Ordered custom sections let organizers present programs, policies, performers, causes, or other event-specific content beyond conferences.

### **Release posture**

The database change is additive. Referral pricing is recalculated by the API, concurrent final-use redemptions are serialized, sensitive demographics stay out of public responses, and organizer-controlled images are not proxied through Axon infrastructure.

**Who benefits most**

## **Best initial buyers**

- Event agencies running multiple stakeholders and many moving parts.
- Institutions and organizers that need professional reporting for sponsors or leadership.
- Teams that already feel pain from missed deliverables, unclear ownership, or late surprises.
- Recurring event operators who want a repeatable operating rhythm, not just a ticketing tool.

## Why this matters beyond product polish

### Higher retention

Axon becomes useful before, during, and after ticket sales instead of only during transaction moments.

### Better enterprise fit

Stakeholder visibility helps Axon speak to sponsors, executives, investors, and institutional buyers.

### Stronger differentiation

The platform owns execution readiness, not only registrations and payments.

### Foundation for future insight

Once readiness data is trusted, Axon can later add smarter reporting, trends, and predictive capabilities.

## If Axon does nothing

Organizers will continue to run the real work of events in external tools. Axon would remain important for transactions, but not for the day-to-day operational behavior that creates stickiness and long-term strategic advantage.

## A simple path from MVP to long-term value

| Phase   | Focus               | What the business gets                                                                       |
|---------|---------------------|----------------------------------------------------------------------------------------------|
| Phase 1 | Foundation          | Organizer onboarding, event workspace, readiness tracking, ownership, stakeholder dashboard. |
| Phase 2 | Event operations    | Volunteers, risk tracking, dependencies, escalations, stronger reporting.                    |
| Phase 3 | Operational insight | Historical trends, organizer learnings, event benchmarks.                                    |
| Phase 4 | Event intelligence  | Recommendations, predictive readiness, event performance forecasting.                        |

### Final recommendation

Proceed with the initiative, but keep the first release disciplined. The best version of this idea is smaller, sharper, and highly event-specific: one workspace per event, clear owners, visible blockers, and a stakeholder-safe dashboard.

**In short: the first release should prove that Axon can become the operational source of truth for events, not just the place where tickets are sold.**
